

Neuro-Electric Machine Control

Overview of the Extension of the
Human Senses Group Activities

Kevin R. Wheeler, Ph.D.
NASA Ames Research Center
kwheeler@mail.arc.nasa.gov

Extension of the Human Senses Group

Principal Investigators:

Kevin R. Wheeler, Ph.D. – Group Lead, EMG recognition

Chuck Jorgensen, Ph.D. – Chief Scientist, silent speech, spiking neurons

Leonard J. Trejo, Ph.D. – EEG Brain Computer Interfaces

Group Members:

Mark Millonas, Ph.D.

Mark Allan, QSS Group Inc.

Charles Curry, QSS Group Inc.

Bryan Matthews, QSS Group Inc.

Shane Agabon, QSS Group Inc.

Diana Lee, SAIC

Jack Culpepper, student,

Walter Lee, student

mu rhythm control:

Real Movement

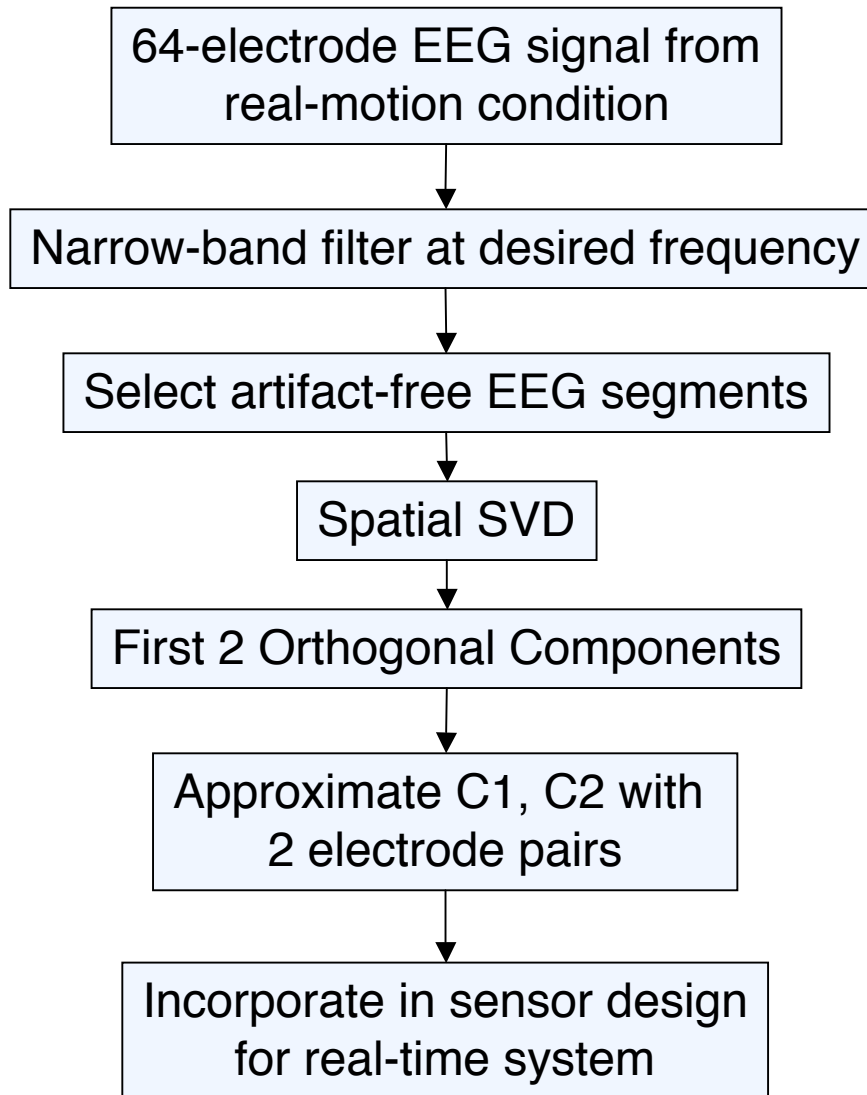

Imagined Movement

Sensor Positioning System

Non-contact Sensor Development

QUASAR Stacked Sensor

Eight-channel EEG plus EOG and QUASAR Sensor Recordings

Lash-up of Mini-differential QUASAR Sensor

Design Goals

Near-term

- Refine non-contact technology
- E-field sensor (normal to scalp)
- Shielded room

Mid-term

- Differential sensor (tangential to scalp)
- Mini sensors (2-3X smaller, thinner, with manufactured cover)

Long-term

- Unshielded room
- Multichannel

QUASAR: Quantum Applied Science and Research Inc.

Application of KPLS and SVM

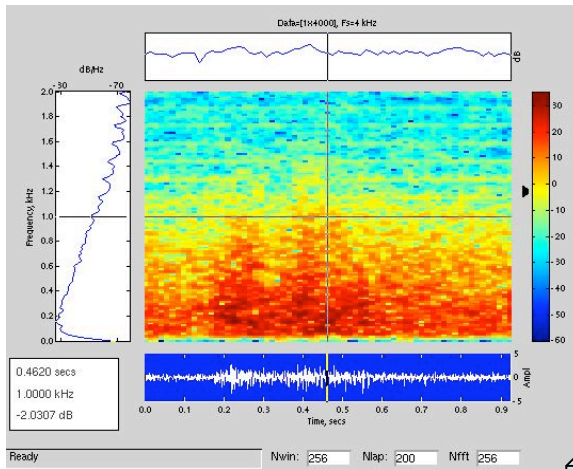

- Classification of EEG patterns associated with single-tap typing motions in three subjects
- Developed and tested a linear PLS preprocessing system
- Combined PLS system with linear SVM classifier
- PLS-SVM system detected single-tap patterns with accuracy of 80% to 95% (an increase of 15% to 30% over previous system)
- Implemented and tested PLS-SVM system in real-time framework

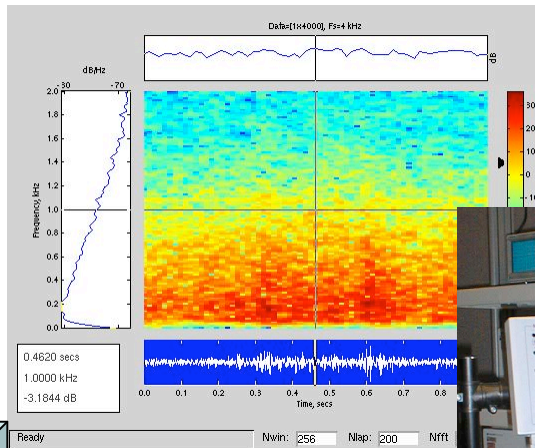

Silent Speech

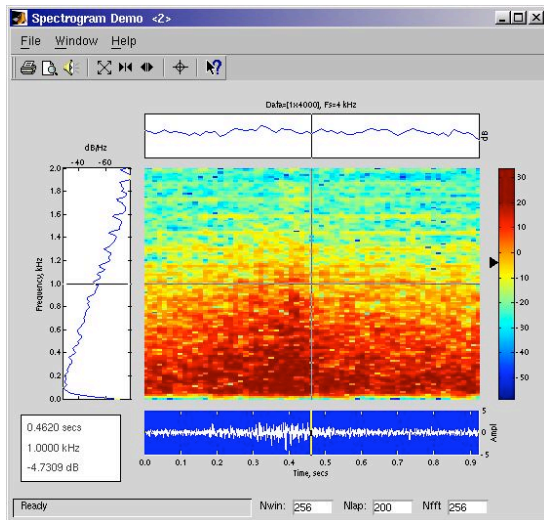

Charles Jorgensen, Ph.D.

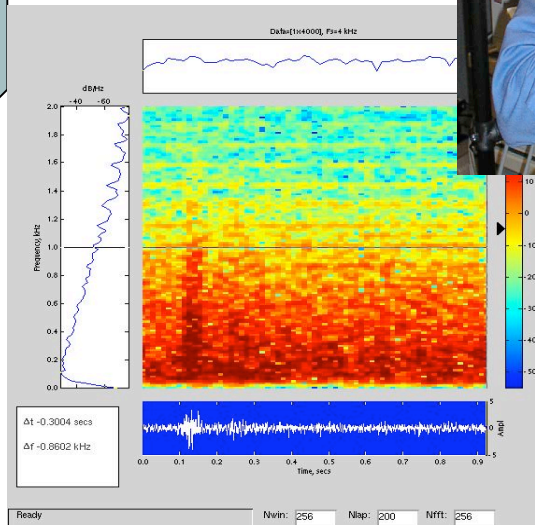

“ Left ”

“ Right ”

“ Stop ”

“ Go ”

The Need for SPEAD

Earth Sciences –

- **data:** large, distributed, heterogeneous formats, lacking docs
- **time waste:**
 - formatting and manipulating files (80/20 rule)
 - implementing machine learning algorithms from literature for discovery tasks
 - lack of scientific method due to accessibility of appropriate forward models (need implementation using first principles)

Neurosciences –

- **data:** never enough, many artifacts, heterogeneous formats
- **time waste:**
 - formatting and manipulating files
 - manual artifact rejection
 - implementing machine learning algorithms for pattern recognition
 - porting from batch to “live” environments for closed-loop experiments

System Requirements

- Easy to program (graphical wiring diagrams)
- Multiple platforms (Mac OS X, Linux)
- Runs on single or multiple machines
- Very fast interactive 2-D & 3-D graphics (OpenGL)
- Support commercial domain packages (e.g. Matlab)
- Seamless transition from batch to streaming processing
- Ability to work with HDF, XML, text, Matlab, and other formats
- Scripts can be run without graphical front-end
- Inclusion of atmospheric forward modeling code for Bayesian inference
- Easy to modify for different scenarios

Conclusion

Collaborations & Partnerships

Atmospheric Inference

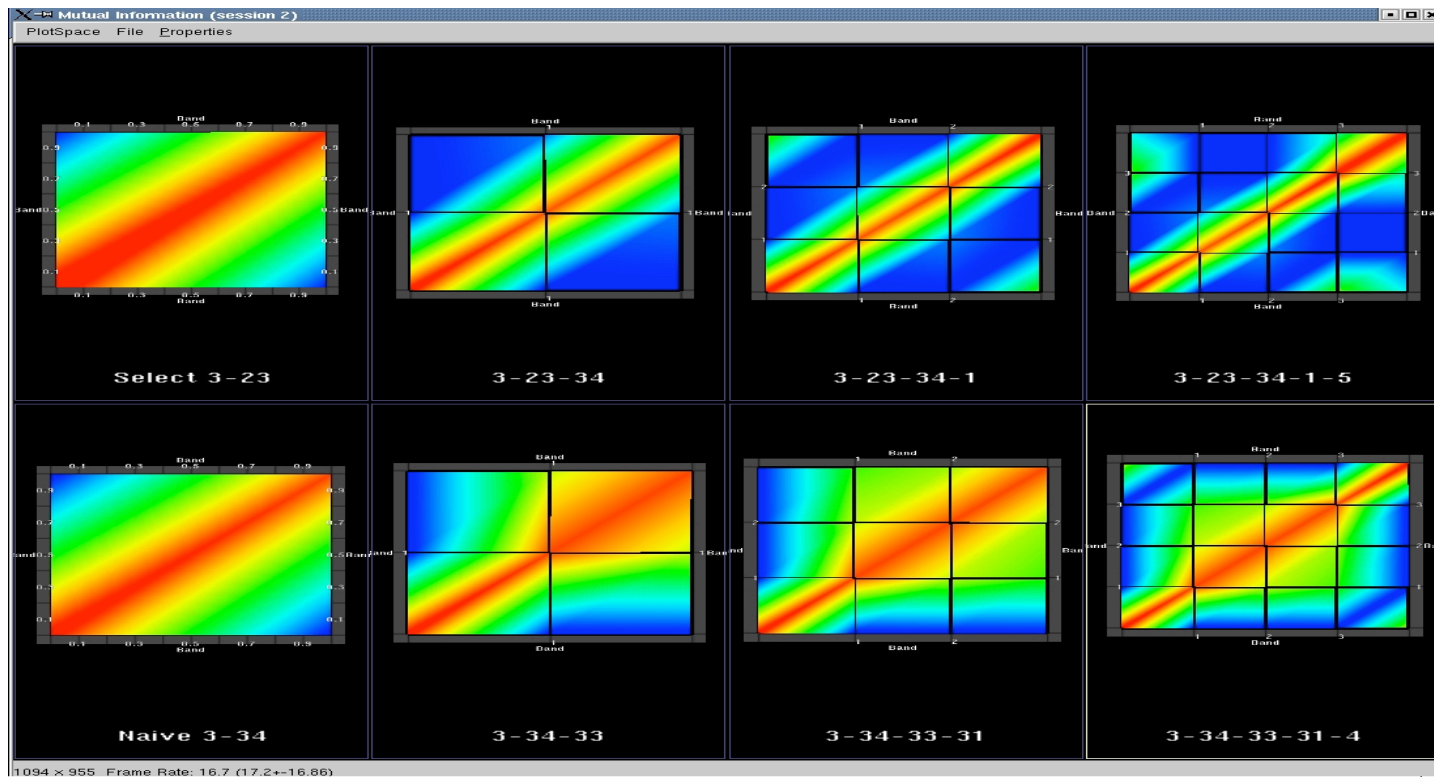

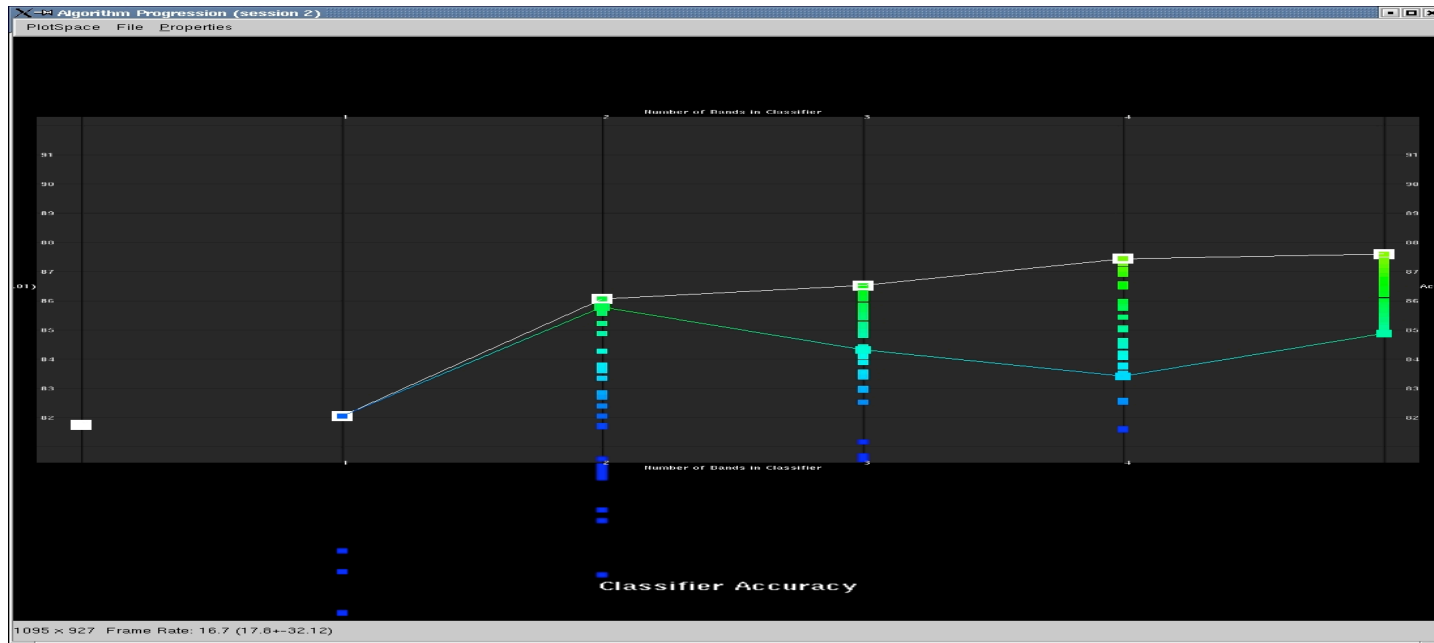

Naïve Bayes Classification

Concluding Goals

- Collaborations & Partnerships:
 - pattern recognition for streaming data problems
 - providing software framework to partners
 - application of bioelectric interfaces to real-world problem domains.
 - converting from full manual to semi-autonomous control
 - atmospheric inference
 - Bayesian modeling techniques
 - Space based construction

Conclusion

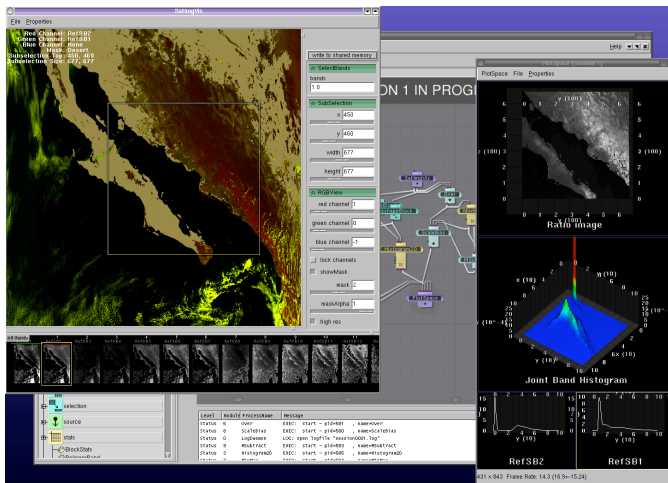

control with gestures

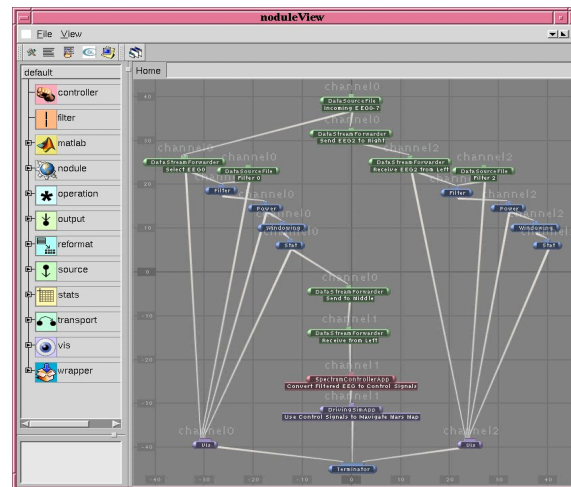

robotic interfaces
semi-autonomy

brain computer interfaces

atmospheric inference

streaming frameworks
